RESULT:

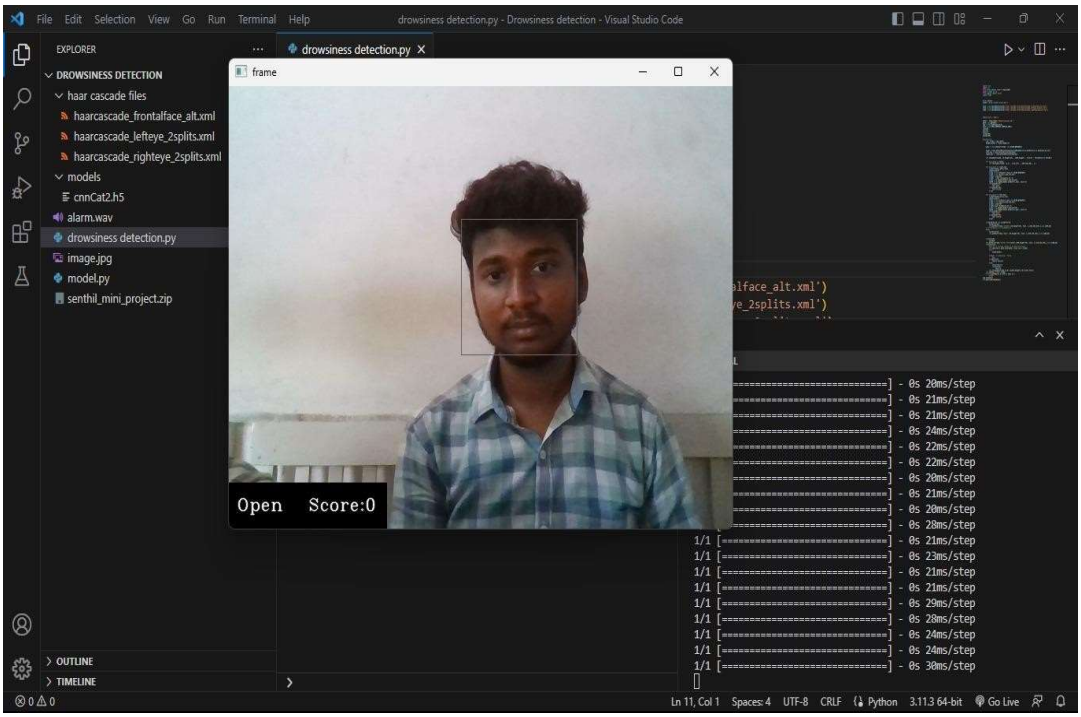

Figure1 test image open eyes

This figure 6. The score value, along with the "Open" label, is displayed on the frame to provide feedback on the person's level of drowsiness. The score increases when closed eyes are detected, indicating a higher probability of drowsiness. On the other hand, an open eye reduces the score, implying a lower likelihood of drowsines

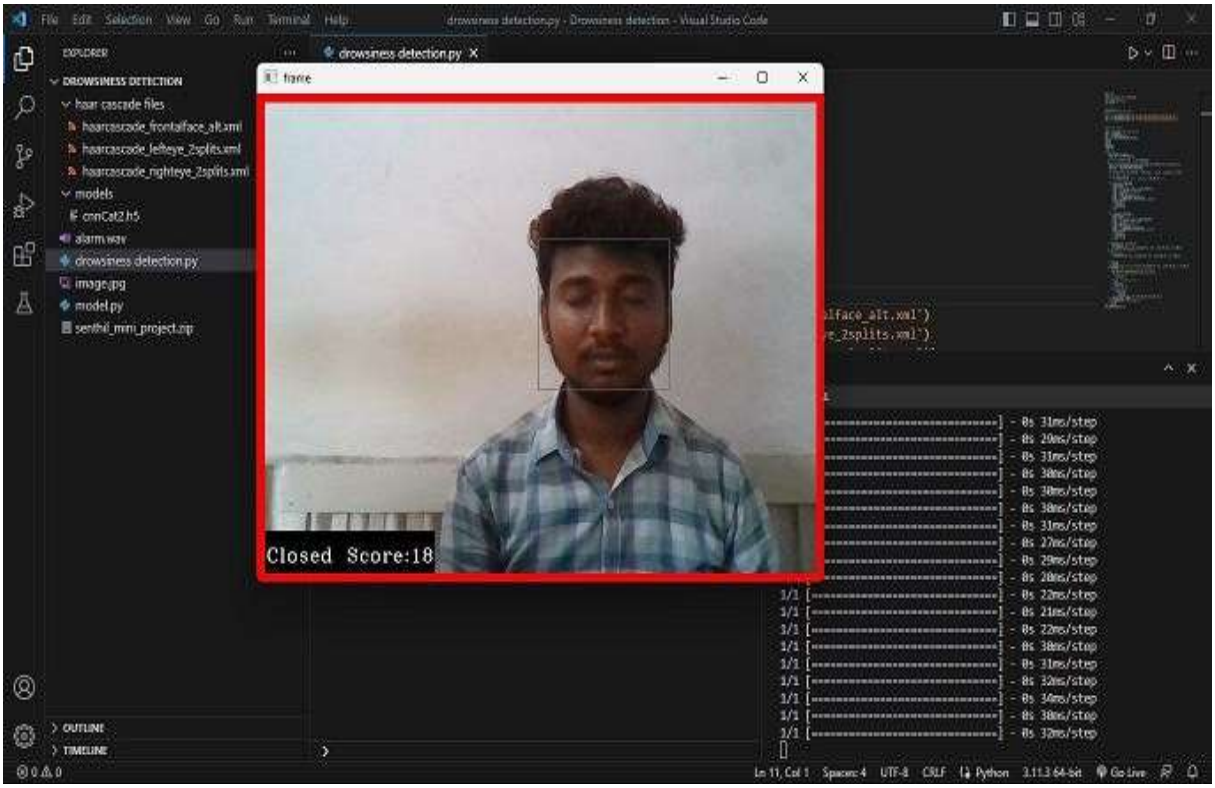

Figure 2 test image close eyes

Figure 6.2 person's eyes in the video frame are detected as being in a closed state. This suggests the possibility of drowsiness or fatigue. The program may play an alarm sound and draw a red rectangle around the frame to alert the user of potential drowsiness.
